Exciting internships in plant science and remote sensing

The Terrestrial Ecosystem Science and Technology group at Brookhaven National Laboratory (New York) is advertising two exciting summer internships.

1: Investigating plant growth using physiology and remote sensing.  
2: Investigating plant stress using physiology and remote sensing.

These projects provide the opportunity to participate in world-class research using remote sensing techniques to increase understanding of plants and ecosystems.

The successful interns will join our friendly and supportive team in summer 2018.
